

# ChE 101: Working with Matrices and Arrays

## Lesson 1: Matrix and Vector Operations (H-3)

Gerardine G. Botte

---

---

---

---

---

---

---

---

## Learning Objectives

---

- Lesson 1:
  - Define matrices
  - Distinguish vectors and matrices
  - Identify square matrices
  - Perform basic matrix operations
    - Sum/subtraction
    - Multiply matrices

---

---

---

---

---

---

---

---

**Review of  
Matrices**

- Definition
- Types of matrices
- Matrix operations

## Matrix Definition

---

- Array of numbers that can be represented in the following form:

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} & \cdots & a_{1m} \\ a_{21} & a_{22} & a_{23} & \cdots & a_{2m} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & a_{n3} & \cdots & a_{nm} \end{bmatrix}$$

row
column

- Where “n” represents the row number
- Where “m” represents the column number
- Matrix A has dimensions (n x m)

---

---

---

---

---

---

---

---

## Exercise 1

- Given the following matrices, identify the dimensions of each matrix, what is the value of the following elements  $a_{12}$ ,  $a_{21}$ ,  $a_{32}$ ,  $a_{22}$

$$A = \begin{bmatrix} 2 & 0.5 & 3 \\ 1.5 & 2.2 & -1 \\ 0 & 10 & 4 \end{bmatrix} \quad B = \begin{bmatrix} 3 & 4 & 7 \\ 2 & 15 & -1 \end{bmatrix} \quad C = \begin{bmatrix} 1 \\ 4 \\ 2 \end{bmatrix}$$

---

---

---

## Types of Matrices

### Review of Matrices

- Definition
- Types of matrices
- Matrix operations

- There are different types of important matrices in linear algebra
- However, for the purpose of this course we will focus on:
  - Vectors
  - Square matrices

ChE 101

4/18/2005

5

---

---

---

---

---

---

---

---

## Vectors

### Review of Matrices

- Definition
- Types of matrices
- Matrix operations

- Vectors are type of matrices that have either one row or one column
- Matrices with one column ( $m=1$ ) are called column vectors, e.g.,

$$\{A\} = \begin{bmatrix} 1 \\ 2 \\ 5 \end{bmatrix}$$

- Matrices with one row ( $n=1$ ) are called row vectors, e.g.,

$$\{B\} = [1 \ 2 \ 3]$$

ChE 101

4/18/2005

6

---

---

---

---

---

---

---

---

## Square matrices

---

**Review of Matrices**

- Definition
- Types of matrices
- Matrix operations

- If  $m=n$ , we have a square matrix, eg:

$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

$$B = \begin{bmatrix} 1 & 0 & 3 & -1 \\ 0 & 1 & 2 & 0.5 \\ 10 & 15 & 2 & 3.5 \\ 4 & 1 & 2 & 0.4 \end{bmatrix}$$

7

---

---

---

---

---

---

---

---

## Matrix Operations

---

**Review of Matrices**

- Definition
- Types of matrices
- Matrix operations

- Addition:
  - Matrices can be added only if they have the same dimensions
  - To add matrices each element must be added
  - Steps for adding matrices:
    - Identify the dimensions of the matrices
    - If the dimensions are not the same the matrices can't be added
    - If the dimensions are the same the matrices can be added by adding each of the individual elements

ChE 101

4/18/2005

8

---

---

---

---

---

---

---

---

## Example Adding Matrices

---

- Given A and B, calculate  $C = A+B$

$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

$$B = \begin{bmatrix} 0 & 2.5 \\ -3 & -2 \end{bmatrix}$$

- Procedure:
  - Dimensions of A: 2x2, Dimensions of B: 2x2
  - Because both matrices have the same dimensions they can be added
  - Elements of C matrix:
    - $c_{11} = a_{11} + b_{11} = 1 + 0 = 1$
    - $c_{12} = a_{12} + b_{12} = 2 + 2.5 = 4.5$
    - $c_{21} = a_{21} + b_{21} = 3 - 3 = 0$
    - $c_{22} = a_{22} + b_{22} = 4 - 2 = 2$

$$C = \begin{bmatrix} 1 & 4.5 \\ 0 & 2 \end{bmatrix}$$

ChE 101

4/18/2005

9

---

---

---

---

---

---

---

---

## Exercise 2

- Given the matrices, A, B, and C obtain matrix  $D = A + B$  and  $E = B + C$

$$A = \begin{bmatrix} 1 & 2 \\ 2 & 3 \end{bmatrix} \quad B = \begin{bmatrix} 2 & 3 \\ 4 & 1 \end{bmatrix} \quad C = \begin{bmatrix} 2 & 2 & 1 \\ 0 & 4 & -1 \\ 2 & 5 & 0.5 \end{bmatrix}$$

---

---

---

---

---

## Matrix Operations

### Review of Matrices

- Definition
- Types of matrices
- Matrix operations

- Subtraction:**
  - Matrices can be subtracted only if they have the same dimensions
  - To subtract matrices each element must be subtracted
  - Steps for subtracting matrices:
    - Identify the dimensions of the matrices
    - If the dimensions are not the same the matrices can't be subtracted
    - If the dimensions are the same the matrices can be subtracted by subtracting each of the individual elements

ChE 101

4/18/2005

11

---

---

---

---

---

---

---

---

## Example Subtracting Matrices

- Given A and B, calculate  $C = A - B$

$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \quad B = \begin{bmatrix} 0 & 2.5 \\ -3 & -2 \end{bmatrix}$$

- Procedure:**
  - Dimensions of A: 2x2, Dimensions of B: 2x2
  - Because both matrices have the same dimensions they can be subtracted
  - Elements of C matrix:
    - $c_{11} = a_{11} - b_{11} = 1 - 0 = 1$
    - $c_{12} = a_{12} - b_{12} = 2 - 2.5 = -0.5$
    - $c_{21} = a_{21} - b_{21} = 3 - (-3) = 6$
    - $c_{22} = a_{22} - b_{22} = 4 - (-2) = 6$

$$C = \begin{bmatrix} 1 & -0.5 \\ 6 & 6 \end{bmatrix}$$

ChE 101

4/18/2005

12

---

---

---

---

---

---

---

---

### Exercise 3

- Given the matrices, A and B, obtain matrix  $C = A - B$

$$A = \begin{bmatrix} 1 & 2 \\ 2 & 3 \end{bmatrix} \quad B = \begin{bmatrix} 2 & 3 \\ 4 & 1 \end{bmatrix}$$

---

---

### Matrix Operations

Review of  
Matrices  
- Definition  
- Types of  
matrices  
- Matrix  
operations

- Multiplication of a matrix by a scalar:
  - If "g" is a scalar, a matrix "A" can be multiply by "g"
  - To do this, we need to multiply each element of matrix "A" by the scalar "g"
  - See procedure below:

$$C = g \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$$

scalar  $\swarrow$   $\searrow$  matrix

$$C = \begin{bmatrix} g * a_{11} & g * a_{12} \\ g * a_{21} & g * a_{22} \end{bmatrix}$$

18/2005

14

---

---

---

---

---

---

---

---

### Exercise 4

- Given the matrices A, B, C, D
- Perform the following calculations
  - $F = A + 0.5D$
  - $G = 2(A+B+C) - D$

$$A = \begin{bmatrix} 1 & 2 \\ 2 & 3 \end{bmatrix} \quad B = \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} \quad C = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \quad D = \begin{bmatrix} -1 & -1 \\ -1 & 0 \end{bmatrix}$$

---

---

---

---

---

---

---

## Exercise 5

---

- Given the matrices X and Y, calculate the matrix  $P = X Y$

$$X = \begin{bmatrix} 3 & 1 \\ 8 & 6 \\ 0 & 4 \end{bmatrix} \quad Y = \begin{bmatrix} 5 & 9 \\ 7 & 2 \end{bmatrix}$$

ChE 101      4/18/2005      20

---

---

---

---

---

---

---

---

## Matrix Operations

---

- Operations of product of matrices
  - The product of two matrices is not commutative
 
$$AB \neq BA$$
  - The product of matrices is associative
 
$$(AB)C = A(BC)$$
  - The product of matrices is distributive
 
$$A(B+C) = (AB) + (AC)$$

ChE 101      4/18/2005      21

---

---

---

---

---

---

---

---

## Exercise 6

- Given the matrices A, B, and C, and the scalar  $g=2$ . Perform the following computation:

$$D = g \cdot A(B+C)$$

$$A = \begin{bmatrix} 1 & 2 \\ 3 & 0 \\ 2 & 1 \end{bmatrix} \quad B = \begin{bmatrix} 1 & 2 \\ 2 & 3 \end{bmatrix} \quad C = \begin{bmatrix} 2 & 3 \\ 4 & 1 \end{bmatrix}$$

## Matrix Operations

Review of  
Matrices  
– Definition  
– Types of  
matrices  
– Matrix  
operations

- Transpose
  - The transpose " $A^T$ " of a matrix "A" transforms rows into columns
  - Given a matrix "A", the transpose matrix " $A^T$ " is the matrix in which  $a_{ij}$  of the transpose is  $a_{ji}$  of the original matrix

ChE 101

---

---

---

## Summary

---

- Can you define a matrix?
- Can you identify a particular element in a matrix?
- What are square matrices?
- What are vectors?
- Can you
  - Add matrices
  - Subtract matrices
  - Multiply matrices (remember product properties)
  - Calculate transpose of matrices
